**JULY 2006 – DEC 2007**

Site investigation of a 1.35ha former asbestos research facility and engineering works in Rochdale. A detailed environmental investigation by window sampling and cable percussive drilling was designed due to the site being politically sensitive. Comprehensive chemical analysis and asbestos screening was undertaken of near surface samples and at depth in close liaison with the Local Authority. A factual and interpretative report was produced.

The geotechnical aspects of the site were investigated using cable percussive drilling. Laboratory and in-situ geotechnical tests were undertaken and the most suitable foundations for the development recommended. A Remedial Strategy was produced for regulatory approval.
